## **Listing of Claims**

This listing of claims will replace all prior versions, and listings, of claims in the application.

- 1 1. (previously presented) A method of inventorying data carriers by means of
- a communication station, wherein said communication station and each data
- 3 carrier are brought into communicative connection, and wherein each data carrier
- 4 brought into communicative connection with the communication station generates
- 5 a response signal enabling the inventorying of the data carrier after at least one
- 6 operational condition has been fulfilled and supplies said response signal using a
- 7 transmission start moment that can be chosen from a plurality of transmission start
- 8 moments that are defined from a carrier signal end moment that coincides with the
- 9 end of a transmission of a carrier signal from said communication station, wherein
- each of the transmission start moments is defined by a common selectable discrete
- time period and a number of waiting time periods from the carrier signal end
- moment, where the number of waiting time periods is defined from the end of the
- common selectable discrete time period, and wherein each data carrier is
- 14 configured to test, before generating its response signal, whether another data
- carrier is transmitting its response signal and wherein each data carrier does not
- 16 generate its response signal if another data carrier is already transmitting its
- 17 response signal.
- 1 2. (canceled).
- 1 3. (previously presented) A method as claimed in claim 1, wherein the
- 2 response signal given is an identification signal.
- 4. (previously presented) A method as claimed in claim 1, wherein the
- 2 number of said waiting periods is selected by a random principle.

- 5. (previously presented) A method as claimed in claim 1, further comprising
- 2 transmitting an inventory command from the communication station during the
- 3 transmission of the carrier signal.
- 6. (previously presented) A method as claimed in claim 1, wherein the
- 2 number of selectable transmission start moments is greater than the number of
- 3 data carriers.
- 1 7. (previously presented) A method as claimed in claim 1, wherein a data
- 2 carrier that has given a response signal can be set to an idle state by the
- 3 communication station, in which idle state no response signal is provided.
- 1 8. (previously presented) A data carrier, which data carrier is designed for
- 2 contactless communication with a communication station and which comprises an
- integrated circuit, which integrated circuit comprises the following means:
- 4 response signal generation means for generating a response signal start moment
- 5 selection means by which a transmission start moment can be selected from a
- 6 plurality of transmission start moments that are defined from a carrier signal end
- 7 moment that coincides with the end of a transmission of a carrier signal from said
- 8 communication station, wherein each of the transmission start moments is defined
- 9 by a common selectable discrete time period and a number of waiting time periods
- from the carrier signal end moment, where the number of waiting time periods is
- defined from the end of the common selectable discrete time period, and response
- signal recognition means designed for recognizing a response signal given by
- another data carrier and for generating and delivering a response signal
- 14 recognition signal and wherein delivery decision means are provided which
- release or block a delivery of the response signal in dependence on the response
- signal recognition signal and the transmission start moment, wherein the data
- carrier is configured to test, before generating its response signal, whether another
- data carrier is transmitting its response signal and wherein the data carrier does
- 19 not generate its response signal if another data carrier is already transmitting its
- 20 response signal.

- 9. (previously presented) A data carrier as claimed in claim 8, wherein the
- 2 response signal generation means are formed by identification signal generation
- 3 means.
- 1 10. (previously presented) A data carrier as claimed in claim 8 or 9, wherein
- the response signal recognition means are designed for recognizing a carrier
- 3 signal.
- 1 11. (previously presented) A data carrier as claimed in claim 8, wherein the
- 2 response signal recognition means are designed for recognizing a modulated
- 3 carrier signal and for this purpose comprise demodulation means which are
- 4 designed for demodulating a modulated carrier signal.
- 1 12. (previously presented) An integrated circuit for a data carrier which data
- 2 carrier is designed for contactless communication with a communication station,
- said integrated circuit comprising the following means: response signal generation
- 4 means for generating a response signal start moment selection means by which a
- 5 transmission start moment can be selected from a plurality of transmission start
- 6 moments that are defined from a carrier signal end moment that coincides with the
- 7 end of a transmission of a carrier signal from said communication station, wherein
- 8 each of the transmission start moments is defined by a common selectable discrete
- 9 time period and a number of waiting time periods from the carrier signal end
- moment, where the number of waiting time periods is defined from the end of the
- common selectable discrete time period, and response signal recognition means
- designed for recognizing a response signal given by another data carrier and for
- 13 generating and delivering a response signal recognition signal and wherein
- delivery decision means are provided which release or block a delivery of the
- response signal in dependence on the response signal recognition signal and the
- transmission start moment, wherein the data carrier is configured to test, before
- generating its response signal, whether another data carrier is transmitting its
- response signal and wherein the data carrier does not generate its response signal
- if another data carrier is already transmitting its response signal.

- 1 13. (previously presented) An integrated circuit as claimed in claim 12,
- 2 wherein the response signal generation means are formed by identification signal
- 3 generation means.
- 1 14. (previously presented) An integrated circuit as claimed in claim 12,
- wherein the response signal recognition means are designed for recognizing a
- 3 carrier signal.
- 1 15. (previously presented) An integrated circuit as claimed in claim 12,
- wherein the response signal recognition means are designed for recognizing a
- modulated carrier signal and for this purpose comprise demodulation means which
- 4 are designed for demodulating a modulated carrier signal.
- 1 16. (previously presented) A method of inventorying data carriers, which
- 2 method comprises the following steps:
- choosing from a plurality of transmission start moments, which are defined
- 4 from a signal end moment that coincides with the end of a transmission of a signal
- 5 from a communication station, a transmission start moment for starting a
- 6 transmission of a carrier response signal for the purpose of supplying data to said
- 7 communication station during the transmission of said carrier signal, wherein the
- data enable the inventory of the data carrier, and wherein each of the transmission
- 9 start moments is defined by a common selectable discrete time period and a
- number of waiting time periods from the signal end moment, where the number of
- waiting time periods is defined from the end of the common selectable discrete
- time period;
- testing, before generating its response signal, whether another data carrier
- is already transmitting a carrier signal after said signal end moment and prior to
- said chosen transmission start moment; and
- inhibiting the starting of said transmission of said carrier signal at said
- chosen transmission start moment if the result of said testing is positive, including
- 18 not generating its response signal if another data carrier is already transmitting its
- 19 response signal.

- 1 17. (previously presented) A method as claimed in claim 16, comprising
- 2 starting the transmission of said carrier signal at the chosen transmission start
- moment if said result of said testing is negative.
- 1 18. (previously presented) A method as claimed in claim 17, comprising
- transmitting a response signal between two time periods during the carrier signal
- 3 transmission to take into account transient phenomena.
- 1 19. (previously presented) A method as claimed in claim 16, wherein the
- transmission start moment is selected by a random principle.
- 1 20. (previously presented) A method as claimed in claim 16, wherein said
- 2 choosing of said transmission start moment allows the number of choose-able
- transmission start moments to be greater than the number of data carriers.
- 1 21. (previously presented) A method as claimed in claim 16, further
- 2 comprising transmitting an inventory command from the communication station
- during the transmission of the signal.
- 1 22. (previously presented) A method as claimed in claim 21, wherein said
- 2 choosing of the transmission start moment comprises shifting said transmission
- 3 start moment in time by a selectable discrete delay period with respect to said end
- 4 of the carrier signal transmission of said communication station.
- 1 23. (previously presented) A method as claimed in claim 17, comprising
- 2 setting said data carrier that has supplied its data as identification data into an idle
- 3 state by the communication station, in which idle state no carrier signal is
- 4 transmitted.
